# Getting Started with ZAP-MSP430

Welcome to the Texas Instruments ZAP (ZigBee Application Processor) development tools for TI's EXP5438 and MSP2618 development kits.

Coupled with a CC2530-based ZNP (ZigBee Network Processor), a ZAP module provides the "host" functionality for a full-featured ZigBee device.

The ZAP package provides projects for two MSP430-based development kits. Pictured below are examples of the MSP2618 (left) and EXP5438 (right) that are available from Texas Instruments to demonstrate ZAP + ZNP capabilities.

To get started, visit www.ti.com/z-stack for everything you need, including the IAR Embedded Workbench for MSP430, development kits, application notes, datasheets, support tools, user guides, and more.
